General Description

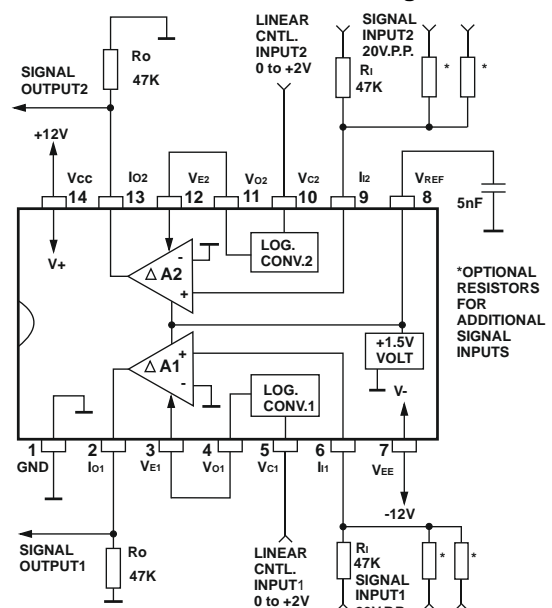

The AS3360 is a dual general purpose voltage controlled transconductor intended for such applications as voltage controlled amplifiers, filters, and waveform generators. Each transconductor independently provides both linear and exponential control scaling over greater than a 100 dB range. Complete with virtual ground summing inputs, wide voltage compliance current outputs, and control inputs referenced to ground, the AS3360 requires exceptionally few external components and is extremely easy to use.

Because of its inherent ultra-low control feedthrough, no trimming is required. Added to these features are exceptionally low noise, wide bandwidth, and operation down to ± 3 volts, making the AS3360 a real cost saver in most applications requiring variable transconductance amplifiers.

Note 1. Current gain is - 20dB to - 80dB. Control voltage is referenced to pin 8.

Note 2. Best straight line. Most of this error occurs at range extremities.

Note 3. Output Signal Current is ±100μA.

Note 4. Over entire control range. Signal input is open.

Note 5. In 16 to 16KHz bandwidth.

Note 6. At 1KHz.

Note 7. For negative supply less than 12 volts, this attenuation is greater.

Note 8. Total supply voltage across chip should not exceed 26V.
